This manual contains important safety information and must be made available to personnel who operate and maintain this machine.
Machine models represented in this manual may be used in various locations world-wide. Machines sold and shipped into European Union Territories require that the machine display the EC Mark and conform to various directives. In such cases, the design specification of this machine has been certified as complying with EC directives. Any modification to any part is absolutely prohibited and would result in the CE Certification and marking being rendered invalid. A declaration of that conformity follows:

DECLARATION OF CONFORMITY WITH EC DIRECTIVES

The contents of this manual are considered to be proprietary and confidential to Ingersoll–Rand and should not be reproduced without the prior written permission of Ingersoll–Rand.

Nothing contained in this document is intended to extend any promise, warranty or representation, expressed or implied, regarding the Ingersoll–Rand products described herein. Any such warranties or other terms and conditions of sale of products shall be in accordance with the standard terms and conditions of sale for such products, which are available upon request.

This manual contains instructions and technical data to cover all routine operation and scheduled maintenance tasks by operation and maintenance staff. Major overhauls are outside the scope of this manual and should be referred to an authorised Ingersoll–Rand service department.

The design specification of this machine has been certified as complying with EC directives. As a result:

(a) Any machine modifications are strictly prohibited, and will invalidate EC certification.

(b) A unique specification for USA/Canada is adopted and tailored to the territory.

All components, accessories, pipes and connectors added to the compressed air system should be:

. of good quality, procured from a reputable manufacturer and, wherever possible, be of a type approved by Ingersoll–Rand
. clearly rated for a pressure at least equal to the machine maximum allowable working pressure.
. compatible with the compressor lubricant/coolant.
. accompanied with instructions for safe installation, operation and maintenance.

Details of approved equipment are available from Ingersoll–Rand Service departments.

The use of repair parts / lubricants / fluids other than those included within the Ingersoll–Rand approved parts list may create hazardous conditions over which Ingersoll–Rand has no control. Therefore Ingersoll–Rand cannot be held responsible for equipment in which non–approved repair parts are installed.

Ingersoll–Rand reserves the right to make changes and improvements to products without notice and without incurring any obligation to make such changes or add such improvements to products sold previously.

The intended uses of this machine are outlined below and examples of unapproved usage are also given, however Ingersoll–Rand cannot anticipate every application or work situation that may arise.

IF IN DOUBT CONSULT SUPERVISION.

This machine has been designed and supplied for use only in the following specified conditions and applications:

. Compression of normal ambient air containing no known or detectable additional gases, vapours, or particles
. Operation within the ambient temperature range specified in the GENERAL INFORMATION section of this manual.

The use of the machine in any of the situation types listed in Table 1:

<table>

</tr>
<tr>
<td>Use of the machine with safety or control components missing or disabled.</td>
</tr>
<tr>
<td>Use of the machine for storage or transportation of materials inside or on the enclosure except when contained within the toolbox.</td>
</tr>
</tbody>
</table>

The company accepts no responsibility for errors in translation of this manual from the original English version.
Ingersoll–Rand, through its distributor, warrants that each item of equipment manufactured by it and delivered hereunder to the initial user will be free of defects in material and workmanship for a period of three (3) months from initial operation or six (6) months from the date of shipment to the initial user, whichever occurs first.

With respect to the following types of equipment, the warranty period enumerated below will apply in lieu of the foregoing warranty period.

A. **Aftercoolers** – The earlier of nine (9) months from date of shipment to or six (6) months from start up by initial user.

B. **Portable Compressors, Portable Generator Sets** – Portable Compressor – 9 Kva through to 550 Kva, Portable Light Towers and Air Dryers – The earlier of twelve (12) months from shipment to or the accumulation of 2,000 hours of operation by the initial user.

**2.5 Kva Through to 8 Kva** – The earlier of twelve (12) months from shipment to or the accumulation of 2,000 hours of operation by the initial user.

Ingersoll–Rand will provide a new part or repaired part, at its sole discretion, in place of any part which is found to be defective in material or workmanship during the period described above. Labor cost to replace the part is the responsibility of the initial user.

C. **Portable Compressor Air Ends** – The earlier of twenty–four (24) months from shipment to or the accumulation of 4,000 hours of service by the initial user. For Air Ends, the warranty against defects will include replacement of the complete Air End, provided the original Air End is returned assembled and all original seals are intact.

C1. **Portable Compressor Airend Limited Extended Warranty** – The earlier of sixty (60) months from shipment to or the accumulation of 10,000 hours of operation by the initial user. This extended warranty is limited to defects in design or defective material or workmanship in rotors, housings, bearings and gears and provided all the following conditions are met:

- The original air end is returned assembled and all original seals are intact.
- Continued use of genuine Ingersoll–Rand parts, fluids, oil and filters.
- Maintenance is performed at prescribed intervals by authorized and properly trained service engineers.

D. **Generator Alternator – 9 Kva through to 550 Kva**. The earlier of twenty–four (24) months from shipment to or the accumulation of 4,000 hours of operation by the initial user.

**2.5 Kva Through to 8 Kva** – The earlier of twelve (12) months from shipment to or the accumulation of 2,000 hours of operation by the initial user.

E. **Portable Light Tower Alternator** – The earlier of twelve (12) months from shipment to or the accumulation of 2,000 hours of operation by the initial user. Light Source model only, the earlier of twenty–four (24) months from shipment to or the accumulation of 4,000 hours of operation by the initial user.

F. **Ingersoll–Rand Engines** – The earlier of twenty–four (24) months from shipment to or the accumulation of 4,000 hours of operation by the initial user.

G. **Ingersoll–Rand Platinum Drive Train Limited Extended Warranty** – Platinum drive train refers to the Ingersoll–Rand Engine and Airend combination. The earlier of sixty (60) months from shipment to, or the accumulation of 10,000 hours of operation by the initial user. The starter, alternator, fuel injection system and all electrical components are excluded from this extended warranty. The airend and drive coupling are included in the warranty but airend drive belts are excluded. This limited extended warranty is automatically available when meeting the following conditions are met:

1. The original airend is returned assembled and unopened.

2. Continued use of genuine Ingersoll–Rand parts, fluids, oil and filters.

3. Maintenance is performed at prescribed intervals by authorized and properly trained service engineers.

Ingersoll–Rand shall be provided with such information as it requires to confirm that these conditions have been complied with.

H1. **Construction Tools, (Portable Power range only)** – Twelve (12) months from shipment to initial user. Ingersoll–Rand will provide a new part or repaired part, at its sole discretion, in place of any part which is found to be defective in material or workmanship during the period described above. Labor cost to replace the part is the responsibility of the initial user.

H2. **Construction Tools Limited Extended Warranty, (Portable Power range only)** – Thirty–six (36) months from shipment to initial user. This extended warranty is automatically available only when the tool is registered with Ingersoll–Rand by completing and submitting the Warranty Registration form. Ingersoll–Rand will provide a new part or repaired part, at its sole discretion, in place of any part which is found to be defective in material or workmanship during the period described above. Labor cost to replace the part is the responsibility of the initial user.

I. **Spare Parts** – Six (6) months from date of shipment to the initial user.

Ingersoll–Rand will provide a new part or repaired part, at its sole discretion, in place of any part that is found to be defective in material and workmanship during the period described above. Such parts will be repaired or replaced without charge to the initial user during normal working hours at the place of business of an Ingersoll–Rand distributor authorized to sell the type of equipment involved or other establishment authorized by Ingersoll–Rand. User must present proof of purchase at the time of exercising warranty.

The above warranties do not apply to failures occurring as a result of abuse, misuse, negligent repairs, corrosion, erosion and normal wear and tear, alterations or modifications made to the product without express written consent of Ingersoll–Rand; or failure to follow the recommended operating practices and maintenance procedures as provided in the product's operating and maintenance publications.

Accessories or equipment furnished by Ingersoll–Rand, but manufactured by others, including, but not limited to, engines, tires, batteries, engine electrical equipment, hydraulic transmissions, carriers, shall carry only the manufacturers warranty, which Ingersoll–Rand can lawfully assign to the initial user.

**THE ABOVE WARRANTIES ARE IN LIEU OF ALL OTHER WARRANTIES EXPRESSED OR IMPLIED, (EXCEPT THAT OF TITLE), AND THERE ARE NO WARRANTIES OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE.**

Extended Limited Airend Warranty

Ingersoll–Rand Portable Compressor Division is pleased to announce the availability of extended limited airend warranty. Announcement of the extended warranty coincides with the introduction of Pro–Tec™ Compressor Fluid, Pro–Tec™ Compressor Fluid is an amber coloured fluid specially formulated for Portable Compressors and is being provided as the factory filled fluid for all machines except 1 XHP650/900/1070

All machines have the standard airend warranty, – The earlier of 24 months from shipment to, or the accumulation of 4000 hours of service by the initial user.

The warranty against defects will include replacement of the complete Airend, provided the original Airend is returned assembled and unopened.

The optional limited warranty is the earlier of 60 months from shipment to, or the accumulation of 10,000 hours of service. The optional warranty is limited to defects in major components (rotors, housings, gears and bearings), and is automatically available when the following conditions are met:

1. The original airend is returned assembled and unopened.
2. Submissions of proof that Ingersoll–Rand fluid, filters and separators have been used. Refer to the Operation and Parts manual for the correct fluids, filters and separator elements required.
3. Submissions of proof that maintenance intervals have been followed.

*BARE AIREND – pertains to major airend parts (rotors, housings, gears and bearings).

**AIREND COMPONENTS – pertains to auxiliary attachments to the bare airend (seals, pumps, valves, tubes, hoses, fittings and filter housing).

Pro–Tec™ and XHP505 Compressor Fluids are available from your local Ingersoll–Rand branch or distributor.

For units operating within the USA & Canada, call the Mocksville Product Support Department on 1–800–633–5206

1 XHP650/900/1070 will continue to use XHP505 and will have the extended warranty when above conditions are met.
WARRANTY REGISTRATION

FOR UNITS SOURCED FROM HINDLEY GREEN, UK

Complete Machine Registration

To initiate the machine warranty, fill out the "Warranty Registration" form 85040285 supplied as part of the machine documentation, keep a copy for your records and mail the original to:

Ingersoll Rand European Sales Ltd
Portable Power Business
Swan Lane
Hindley Green
Wigan
Lancashire
WN2 4EZ
U.K.

Attn: Customer Service Department

Note: Completion of this form validates the warranty.

Engine Registration:

I–R powered machines do not require separate engine registration.

Deutz require a separate engine registration form to be completed and mailed direct to their Cologne office. The form is supplied as part of the machine documentation for Deutz powered machines.

Caterpillar, Cummins and Perkins do not require a separate registration form but they stipulate that any new engine should be registered with their local dealer to initiate warranty.

You MUST provide proof of the “in-service” date when requesting engine warranty repairs.
WARRANTY REGISTRATION

FOR UNITS SOURCED FROM MOCKSVILLE, USA

Complete Machine Registration

Machines shipped to locations within the United States do not require a warranty registration unless the machine status changes (i.e. change of ownership).

Machines shipped outside the United States require notification be made to initiate the machine warranty.

Fill out the Warranty Registration Form in this section, keep a copy for your records and mail form to:

Ingersoll–Rand Company
P.O. Box 868
Mocksville, North Carolina 27028
Attn: Warranty Department

Note: Completion of this form validates the warranty.

Engine Registration:

I–R powered machines do not require separate engine registration.

John Deere requires a separate engine registration be completed and mailed direct to John Deere.

Separate engine registration material is included with this literature package for John Deere powered machines.

All other engine manufacturers do not require a separate engine registration.

You MUST present proof of in–service date at time of requesting engine warranty service.

⚠️ **DANGER**  
Air discharged from this machine can contain carbon monoxide or other contaminants which will cause serious injury or death. Do not breathe this air.

⚠️ **WARNING**  
Trapped air pressure. Can cause serious injury or death.
Close service valve and operate tool to vent trapped air before performing any service.

⚠️ **WARNING**  
Hot pressurized fluid. Can cause serious burns.
Do not open radiator while hot.

⚠️ **WARNING**  
Rotating Fan Blade. CAN cause serious injury.
Do NOT operate with guard removed.
**WARNING**
Improper operation of this equipment. CAN cause serious injury or death.

Read Operator’s Manual supplied with this machine before operation or servicing.

Modification or alteration of this machine. CAN cause serious injury or death.

Do NOT alter or modify this machine without the express written consent of the manufacturer.

Ingersoll–Rand Co., Mocksville, N.C. 27028

**WARNING**
Disconnected Air Hoses Whip. CAN cause serious injury or death. When using air tools attach safety device (OSHA Valve) at source of air supply for each tool.

Ingersoll–Rand Co., Mocksville, N.C. 27028

**WARNING**
High pressure air. Can cause serious injury or death.

Relieve pressure before removing filler plugs/caps, fittings or covers.

Ingersoll–Rand Co., Mocksville, N.C. 27028

**WARNING**
Trapped air pressure. Can cause serious injury or death.

Close service valve and operate tool to vent trapped air before performing any service.

Ingersoll–Rand Co., Mocksville, N.C. 27028

**WARNING**
Falling off machine. CAN cause serious injury or death.

Access Lifting Bail from inside machine.

**WARNING**
Door under pressure CAN cause serious injury.

Use both hands to open door when machine is running.
To promote communication of Safety Warnings on products manufactured by the Portable Compressor Division in Mocksville, N.C., Safety Decals are available free of charge. Safety decals are identified by the decal heading: **DANGER, WARNING or CAUTION**.

Decal part numbers are on the bottom of each decal and are also listed in the compressor's parts manual. Submit orders for Safety Decals to the Mocksville Parts Service Department. The no charge order should contain only Safety Decals. Help promote product safety! Assure that decals are present on the machines. Replace decals that are not readable.
This section pertains only to machines distributed within the United States.

WARNING

TAMPERING WITH NOISE CONTROL SYSTEM PROHIBITED

Federal law prohibits the following acts or the causing thereof:

(1) The removal or rendering inoperative by any persons, other than for purposes of maintenance, repair, or replacement, of any device or element of design incorporated into any new compressor for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; or (2) the use of the compressor after such device or element of design has been removed or rendered inoperative by any person.

Among those acts included in the prohibition against tampering are these:

1. Removal or rendering inoperative any of the following:
   a. the engine exhaust system or parts thereof
   b. the air intake system or parts thereof
   c. enclosure or parts thereof

2. Removal of any of the following:
   a. fan shroud
   b. vibration mounts
   c. sound absorption material

3. Operation of the compressor with any of the enclosure doors open.

Compressor Noise Emission Control Information

A. The removal or rendering inoperative, other than for the purpose of maintenance, repair, or replacement of any noise control device or element of design incorporated into this compressor in compliance with the noise control act;

B. The use of this compressor after such device or element of design has been removed or rendered inoperative.

Note: the above information applies only to units that are built in compliance with the U.S. Environmental Protection Agency.

Ingersoll–Rand Company reserves the right to make changes or add improvements without notice and without incurring any obligation to make such changes or add such improvements to products sold previously.

The Purchaser is urged to include the above provisions in any agreement for any resale of this compressor.
The Noise Control Act of 1972 (86 Stat. 1234) prohibits tampering with the noise control system of any compressor manufactured and sold under the above regulations, specifically the following acts or the causing thereof:

(1) The removal or rendering inoperative by any persons, other than for purposes of maintenance, repair, or replacement, of any device or element of design incorporated into any new compressor for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; or (2) the use of the compressor after such a device or element of design has been removed or rendered inoperative by any person.

**NOISE EMISSION WARRANTY**

The manufacturer warrants to the ultimate purchaser and each subsequent purchaser that this air compressor was designed, built and equipped to conform at the time of sale to the first retail purchaser, with all applicable U.S. EPA Noise Control Regulations.

This warranty is not limited to any particular part, component, or system of the air compressor. Defects in the design, assembly, or in any part, component, or system of the compressor which, at the time of sale to the first retail purchaser, caused noise emissions to exceed Federal Standards are covered by this warranty for the life of the air compressor. (40FR204.58–1).
**INTRODUCTION**

The unit for which this Maintenance Log is provided conforms to U.S. E.P.A. Regulations for Noise Emissions, applicable to Portable Air Compressors.

The purpose of this book is to provide (1) the Maintenance Performance Schedule below for all required noise emission controls and (2) space so that the purchaser or owner can record what maintenance was done, by whom, where and when. Detailed instructions on the maintenance items below are given on the following page.

**MAINTENANCE SCHEDULE**

A. COMPRESSED AIR LEAKS

Correct all compressed air leaks during the first shutdown period after discovery. If severe enough to cause serious noise problems and efficiency loss, shut down immediately and correct the leak(s).

B. SAFETY AND CONTROL SYSTEMS

Repair or replace all safety and control systems or circuits as malfunction occurs. No compressor should be operated with either system bypassed, disabled, or nonfunctional.

C. ACOUSTIC MATERIALS

In daily inspections, observe these materials. Maintain all acoustic material as nearly as possible in its original condition. Repair or replace all sections that have: 1) sustained damage, 2) have partially separated from panels to which they were attached, 3) are missing, or have otherwise deteriorated due to severe operating or storage conditions.

D. FASTENERS

All fasteners such as hinges, nuts, bolts, clamps, screws, rivets and latches should be inspected for looseness after each 100 hours of operation. They should be retightened, repaired, or – if missing – replaced immediately to prevent subsequent damage and noise emission increase.

E. ENCLOSURE PANELS

Enclosure panels should also be inspected at 100 hour operational intervals. All panels that are warped, punctured, torn, or otherwise deformed, such that their noise containment function is reduced, should be repaired or replaced before the next operation interval. Doors, access panels, and hatch closures especially, should be checked and adjusted at this time to insure continuous sealing between gasket or acoustic material and the mating frame.

F. AIR INTAKE AND ENGINE EXHAUST

Engine and compressor air intake and engine exhaust systems should be inspected after each 100 hours of operation for loose, damaged, or deteriorated components. Repairs or replacements should be made before the next period of use.

G. COOLING SYSTEMS

All components of the cooling systems for engine water and compressor oil should be inspected every 250 hours of use. Any discrepancies found should be corrected before placing the unit back in operation. Unrestricted airflow over the radiator and oil cooler must be maintained at all times during operation.

H. ISOLATION MOUNTS

Engine/airend isolation mounts should be inspected after each 250 hours of operation. Those mounts with cracks or splits in the molded rubber, or with bent or broken bolts due to operation or storage in severe environments, all should be replaced with equivalent parts.

I. ENGINE OPERATION

Inspect and maintain engine condition and operation as recommended in the manuals supplied by the engine manufacturer.

J. FUELS AND LUBRICANTS

Use only the types and grades of fuels and lubricants recommended in the Ingersoll–Rand Company and Engine Manufacturer's Operator and Maintenance Manuals.

## General Information

Never operate unit without first observing all safety warnings and carefully reading the operation and maintenance manual shipped from the factory with this machine.

- Ensure that the operator reads and understands the decals and consults the manuals before maintenance or operation.
- Ensure that the Operation and Maintenance manual, and the manual holder, are not removed permanently from the machine.
- Ensure that maintenance personnel are adequately trained, competent and have read the Maintenance Manuals.
- Make sure that all protective covers are in place and that the canopy/doors are closed during operation.

The specification of this machine is such that the machine is not suitable for use in flammable gas risk areas. If such an application is required then all local regulations, codes of practice and site rules must be observed. To ensure that the machine can operate in a safe and reliable manner, additional equipment such as gas detection, exhaust spark arrestors, and intake (shut-off) valves may be required, dependent on local regulations or the degree of risk involved.

A weekly visual check must be made on all fasteners/fixing screws securing mechanical parts. In particular, safety-related parts such as coupling hitch, drawbar components, road-wheels, and lifting bail should be checked for total security.

All components which are loose, damaged or unserviceable, must be rectified without delay.

Air discharged from this machine may contain carbon monoxide or other contaminants which will cause serious injury or death. Do not breathe this air.

This machine produces loud noise with the doors open or service valve vented. Extended exposure to loud noise can cause hearing loss. Always wear hearing protection when doors are open or service valve is vented.

Never inspect or service unit without first disconnecting battery cable(s) to prevent accidental starting.

Do not use petroleum products (solvents or fuels) under high pressure as this can penetrate the skin and result in serious illness. Wear eye protection while cleaning unit with compressed air to prevent debris from injuring eye(s).

Rotating fan blade can cause serious injury. Do not operate without guard in place.

Use care to avoid contacting hot surfaces (engine exhaust manifold and piping, air receiver and air discharge piping, etc.).

### CAUTIONS

- Ether is an extremely volatile, highly inflammable gas. When it is specified as a starting aid, use sparingly. DO NOT USE ETHER IF THE MACHINE HAS GLOW PLUG STARTING AID OR ENGINE DAMAGE WILL RESULT.
- Never operate unit with guards, covers or screens removed. Keep hands, hair, clothing, tools, blow gun tips, etc. well away from moving parts.

### Compressed air

Compressed air can be dangerous if incorrectly handled. Before doing any work on the unit, ensure that all pressure is vented from the system and that the machine cannot be started accidentally.

- Ensure that the machine is operating at the rated pressure and that the rated pressure is known to all relevant personnel.
- All air pressure equipment installed in or connected to the machine must have safe working pressure ratings of at least the machine rated pressure.
- If more than one compressor is connected to one common downstream plant, effective check valves and isolation valves must be fitted and controlled by work procedures, so that one machine cannot accidently be pressurised / over pressurised by another.
- Compressed air must not be used for a direct feed to any form of breathing apparatus or mask.

High Pressure Air can cause serious injury or death. Relieve pressure before removing filler plugs/caps, fittings or covers.

Air pressure can remain trapped in air supply line which can result in serious injury or death. Always carefully vent air supply line at tool or vent valve before performing any service.

The discharged air contains a very small percentage of compressor lubricating oil and care should be taken to ensure that downstream equipment is compatible.

If the discharged air is to be ultimately released into a confined space, adequate ventilation must be provided.

When using compressed air always use appropriate personal protective equipment.

All pressure containing parts, especially flexible hoses and their couplings, must be regularly inspected, be free from defects and be replaced according to the Manual instructions.

Avoid bodily contact with compressed air.

The safety valve located in the separator tank must be checked periodically for correct operation.

Whenever the machine is stopped, air will flow back into the compressor system from devices or systems downstream of the machine unless the service valve is closed. Install a check valve at the machine service valve to prevent reverse flow in the event of an unexpected shutdown when the service valve is open.
Disconnected air hoses whip and can cause serious injury or death. Always attach a safety flow restrictor to each hose at the source of supply or branch line in accordance with OSHA Regulation 29CFR Section 1926.302(b).

Never allow the unit to sit stopped with pressure in the receiver–separator system.

**Materials**

The following substances may be produced during the operation of this machine:
- brake lining dust
- engine exhaust fumes

**AVOID INHALATION**

Ensure that adequate ventilation of the cooling system and exhaust gases is maintained at all times.

The following substances are used in the manufacture of this machine and may be hazardous to health if used incorrectly:
- compressor lubricant
- engine lubricant
- preservative grease
- rust preventative
- diesel fuel
- battery electrolyte

**AVOID INGESTION, SKIN CONTACT AND INHALATION OF FUMES**

Should compressor lubricant come into contact with the eyes, then irrigate with water for at least 5 minutes.

Should compressor lubricant come into contact with the skin, then wash off immediately.

Consult a physician if large amounts of compressor lubricant are ingested.

Consult a physician if compressor lubricant is inhaled.

Never give fluids or induce vomiting if the patient is unconscious or having convulsions.

Safety data sheets for compressor and engine lubricants should be obtained from the lubricant supplier.

Never operate the engine of this machine inside a building without adequate ventilation. Avoid breathing exhaust fumes when working on or near the machine.

This machine may include such materials as oil, diesel fuel, antifreeze, brake fluid, oil/air filters and batteries which may require proper disposal when performing maintenance and service tasks. Contact local authorities for proper disposal of these materials.

**Battery**

A battery contains sulphuric acid and can give off gases which are corrosive and potentially explosive. Avoid contact with skin, eyes and clothing. In case of contact, flush area immediately with water.

**DO NOT ATTEMPT TO SLAVE START A FROZEN BATTERY SINCE THIS MAY CAUSE IT TO EXPLODE.**

Exercise extreme caution when using booster battery. To jump battery, connect ends of one booster cable to the positive (+) terminal of each battery. Connect one end of other cable to the negative (–) terminal of the booster battery and other end to a ground connection away from dead battery (to avoid a spark occurring near any explosive gases that may be present). After starting unit, always disconnect cables in reverse order.

**Radiator**

Hot engine coolant and steam can cause injury. Ensure that the radiator filler cap is removed with due care and attention.

Do not remove the pressure cap from a HOT radiator. Allow radiator to cool down before removing pressure cap.

**Transport**

When loading or transporting machines ensure that the specified lifting and tie down points are used.

When loading or transporting machines ensure that the towing vehicle, its size, weight, towing hitch and electrical supply are all suitable to provide safe and stable towing at speeds either, up to the legal maximum for the country in which it is being towed or, as specified for the machine model if lower than the legal maximum.

Ensure that the maximum trailer weight does not exceed the maximum gross weight of the machine (by limiting the equipment load), limited by the capacity of the running gear.

**Note:**

Gross mass (on data plate) is for the basic machine and fuel only, excluding any fitted options, tools, equipment and foreign materials.

Before towing the machine, ensure that:
- the tyres and towing hitch are in a serviceable condition.
- the canopy is secure.
- all ancillary equipment is stored in a safe and secure manner.
- the brakes and lights are functioning correctly and meet necessary road traffic requirements.
- break-away cables/safety chains are connected to the towing vehicle.

The machine must be towed in a level attitude in order to maintain correct handling, braking and lighting functions. This can be achieved by correct selection and adjustment of the vehicle towing hitch and, on variable height running gear, adjustment of the drawbar.

To ensure full braking efficiency, the front (towing eye) section must always be set level.

When adjusting variable height running gear:

Ensure front (towing eye) section is set level

When raising towing eye, set rear joint first, then front joint.

When lowering towing eye, set front joint first, then rear joint.

After setting, fully tighten each joint by hand and then tighten further to the next pin. Refit the pin.
When parking always use the handbrake and, if necessary, suitable wheel chocks.

Make sure wheels, tyres and tow bar connectors are in safe operating condition and tow bar is properly connected before towing.

Safety chains / connections and their adjustment

The legal requirements for the joint operation of the breakaway cable and safety chains are as yet unidentified by 71/320/EEC or UK regulations. Consequently we offer the following advice / instructions.

Where brakes only are fitted:

a) Ensure that the breakaway cable is securely coupled to the handbrake lever and also to a substantial point on the towing vehicle.

b) Ensure that the effective cable length is as short as possible, whilst still allowing enough slackness for the trailer to articulate without the handbrake being applied.

Where brakes and safety chains are fitted:

a) Loop the chains onto the towing vehicle using the towing vehicle hitch as an anchorage point, or any other point of similar strength.

b) Ensure that the effective chain length is as short as possible whilst still allowing normal articulation of the trailer and effective operation of the breakaway cable.

Where safety chains only are fitted:

a) Loop the chains onto the towing vehicle using the towing vehicle hitch as an anchorage point, or any other point of similar strength.

b) When adjusting the safety chains there should be sufficient free length in the chains to allow normal articulation, whilst also being short enough to prevent the towbar from touching the ground in the event of an accidental separation of the towing vehicle from the trailer.

#### LUBRICATING OIL SPECIFICATION

**ABOVE −23°C (−9°F)**
- Recommended: Pro–Tec™
- Approved: SAE 10W, API CF–4/CG–4

**BELOW −23°C (−9°F)**
- Mandatory: I–R Performance 500

Ingersoll–Rand Pro–Tec™ compressor fluid is factory–fitted, for use at all ambient temperatures above −23°C (−9°F).

**NOTE:** Warranty may be extended only by continuous use of Pro–Tec™ and Ingersoll–Rand oil filters and separators.

No other oil/fluids are compatible with Pro–Tec™

No other oils/fluids should be mixed with Pro–Tec™ because the resulting mixture could cause damage to the airend.

In the event that Pro–Tec™ is not available and/or the end user needs to use an approved single grade engine oil, the complete system including separator/receiver, cooler and pipework must be flushed clear of the first fill fluid and new Ingersoll–Rand oil filters installed.

When this has been completed, the following oils are approved:

- **a)** for ambient temperatures above −23°C (−9°F),
  - SAE 10W, API CF–4/CG–4

- **b)** for ambient temperatures below −23°C (−9°F),
  - I–R Performance 500 only

Safety data sheets can be obtained on request from the lubricant supplier.

For temperatures outside the specified ambient range, consult Ingersoll–Rand.

*Further information may be obtained by request through Ingersoll–Rand customer services department.*
COMMISSIONING

Upon receipt of the unit, and prior to putting it into service, it is important to adhere strictly to the instructions given below in PRIOR TO STARTING.

Ensure that the operator reads and understands the decals and consults the manuals before maintenance or operation.

Ensure that the position of the emergency stop device is known and recognised by its markings. Ensure that it is functioning correctly and that the method of operation is known.

Running gear drawbar – Machines are shipped to some areas with the drawbar removed. Fitting involves four nuts / bolts to secure the drawbar to the axle and two bolts to fit the drawbar to the front of the machine with the saddle and spacer block.

Support the front of the machine, fit the wheel chocks to stop the machine moving and attach the drawbar. Refer to the torque value table in the MAINTENANCE section of this manual for the correct torque values.

WARNING: This is a safety critical procedure. Double check the torque settings after assembly.

Fit the propstand and coupling. Remove the supports and set the machine level.

Before towing the unit, ensure that the tyre pressures are correct (refer to the GENERAL INFORMATION section of this manual) and that the handbrake is functioning correctly (refer to the MAINTENANCE section of this manual). Before towing the unit during the hours of darkness, ensure that the lights are functioning correctly (where fitted).

WARNING: All air pressure equipment installed in or connected to the machine must have safe working pressure ratings of at least the machine rated pressure, and materials compatible with the compressor lubricant (refer to the GENERAL INFORMATION section).

WARNING: If more than one compressor is connected to one common downstream plant, effective check valves and isolation valves must be fitted and controlled by work procedures, so that one machine cannot accidently be pressurised / over pressurised by another.

WARNING: If flexible discharge hoses are to carry more than 7 bar pressure then it is recommended that safety retaining wires are used on the hoses.

Ensure that all transport and packing materials are discarded.

Ensure that the correct fork lift truck slots or marked lifting / tie down points are used whenever the machine is lifted or transported.

When selecting the working position of the machine ensure that there is sufficient clearance for ventilation and exhaust requirements, observing any specified minimum dimensions (to walls, floors etc.).

Adequate clearance needs to be allowed around and above the machine to permit safe access for specified maintenance tasks.

Ensure that the machine is positioned securely and on a stable foundation. Any risk of movement should be removed by suitable means, especially to avoid strain on any rigid discharge piping.

Attach the battery cables to the battery(s) ensuring that they are tightened securely. Attach the negative cable before attaching the positive cable.
PRIOR TO STARTING

1. Place the unit in a position that is as level as possible. The design of the unit permits a 15 degree lengthways and sideways limit on out of level operation. It is the engine, not the compressor, that is the limiting factor.

   When the unit has to be operated out of level, it is important to keep the engine oil level near the high level mark (with the unit level).

   **CAUTION:** Do not overfill either the engine or the compressor with oil.

2. Check the engine lubrication oil in accordance with the operating instructions in the Engine Operator’s Manual.

3. Check the compressor oil level in the sight glass located on the separator tank.

4. Check the diesel fuel level. A good rule is to top up at the end of each working day. This prevents condensation from occurring in the tank.

   **CAUTION:** Use only a No. 2–D diesel fuel oil with a minimum octane number of 45 and a sulphur content not greater than 0.5%.

   **CAUTION:** When refuelling—
   - switch off the engine.
   - do not smoke.
   - extinguish all naked lights.
   - do not allow the fuel to come into contact with hot surfaces.
   - wear personal protective equipment.

5. Drain the fuel filter water separator of water, ensuring that any released fuel is safely contained.

6. Open the service valve(s) to ensure that all pressure is relieved from the system. Close the service valve(s).

7. **CAUTION:** Do not operate the machine with the canopy/doors in the open position as this may cause overheating and operators to be exposed to high noise levels.

8. Check the radiator coolant level (with the unit level).

   Check the air restriction indicator(s). Refer to the MAINTENANCE section of this manual.

When starting or operating the machine in temperatures below or approaching 0°C, ensure that the operation of the regulation system, the unloader valve, the safety valve, and the engine are not impaired by ice or snow, and that all inlet and outlet pipes and ducts are clear of ice and snow.
STARTING THE MACHINE

WARNING: Under no circumstances should volatile liquids such as Ether be used for starting this machine.

All normal starting functions are incorporated in the key operated switch.

- Turn the key switch to position 2 and hold for 5 seconds to allow the glow plugs to reach working temperature.
- Turn the key switch to position 3 (engine start position).
- Release to position 1 when the engine starts.

At temperatures below 0°C or if there is difficulty starting first time:

- Open the service valve fully, with no hose connected.
- Complete starting sequence above.
- Close service valve as soon as engine runs freely.
- Do not allow machine to run for long periods with service valve open.
- Allow the engine to reach operating temperature.
- At this point in the operation of the machine it is safe to apply full load to the engine.

NOTE: Wear hearing protection at all times when the engine is started with the service valve open and air is flowing from the valve.

PUSH AFTER WARM UP – OPTION ONLY

NOTE: In order to allow the machine to start at a reduced load, a valve, which is operated by a button located on the instrument panel, is incorporated in the regulation system. (The valve automatically returns to the start position when the machine is switched off and air pressure relieved from the system).

- Allow the engine to reach its operating temperature – then press the button (A).
- At this point in the operation of the machine it is safe to apply full load to the engine.

STOPPING THE MACHINE

- Close the service valve.
- Allow the machine to run unloaded for a short period of time to reduce the engine temperature.
- Turn the start switch to the 0 (off) position.

NOTE: As soon as the engine stops, the automatic blowdown valve will relieve all pressure from the system.

If the automatic blowdown valve fails to operate, then pressure must be relieved from the system by means of the service valve(s).

CAUTION: Never allow the machine to stand idle with pressure in the system.

EMERGENCY STOPPING

In the event that the unit has to be stopped in an emergency, TURN THE KEY SWITCH LOCATED ON THE INSTRUMENT PANEL TO THE 0 (OFF) POSITION.

RE-STARTING AFTER AN EMERGENCY

If the machine has been switched off because of a machine malfunction, then identify and correct the fault before attempting to re-start.

If the machine has been switched off for reasons of safety, then ensure that the machine can be operated safely before re-starting.

Refer to the PRIOR TO STARTING and STARTING THE UNIT instructions earlier in this section before re-starting the machine.
MONITORING DURING OPERATION

Should any of the safety shut-down conditions occur, the unit will stop. These are:

. Low engine oil pressure
. High air discharge temperature
. High engine water temperature

**CAUTION:** To ensure an adequate flow of oil to the compressor at low temperature, never allow the discharge pressure to fall below 3,5 bar.

DECOMMISSIONING

When the machine is to be permanently decommissioned or dismantled, it is important to ensure that all hazard risks are either eliminated or notified to the recipient of the machine. In particular:

. Do not destroy batteries or components containing asbestos without containing the materials safely.
. Do not dispose of any pressure vessel that is not clearly marked with its relevant data plate information or rendered unusable by drilling, cutting etc.
. Do not allow lubricants or coolants to be released into land surfaces or drains.
. Do not dispose of a complete machine without documentation relating to instructions for its use.

*Disregard if not appropriate for this particular machine.

(1) or 3000 miles/5000km whichever is the sooner
(2) or as defined by local or national legislation

C = Check (adjust, clean or replace as necessary)

CBT = check before towing.

CR = Check and report

D = Drain
G = Grease
R = Replace
T = Test
W I = or when indicated if earlier.

Refer to specific sections of the operator’s manual for more information.
ROUTINE MAINTENANCE

This section refers to the various components which require periodic maintenance and replacement.

The SERVICE/MAINTENANCE CHART indicates the various components' descriptions and the intervals when maintenance has to take place. Oil capacities, etc., can be found in the GENERAL INFORMATION section of this manual.

For any specification or specific requirement on service or preventative maintenance for the engine, refer to the Engine Manufacturer's Manual.

Compressed air can be dangerous if incorrectly handled. Before doing any work on the unit, ensure that all pressure is vented from the system and that the machine cannot be started accidentally.

If the automatic blowdown fails to operate, then pressure must be gradually relieved by operating the manual blowdown valve. Suitable personal protective equipment should be worn.

Ensure that maintenance personnel are adequately trained, competent and have read the Maintenance Manuals.

Prior to attempting any maintenance work, ensure that:

. all air pressure is fully discharged and isolated from the system. If the automatic blowdown valve is used for this purpose, then allow enough time for it to complete the operation.

. The discharge pipe / manifold area must be kept depressurised by opening the discharge valve, whilst keeping clear of any airflow from it.

. the machine cannot be started accidentally or otherwise, by posting warning signs and/or fitting appropriate anti–start devices.

. all residual electrical power sources (mains and battery) are isolated.

Prior to opening or removing panels or covers to work inside a machine, ensure that:

. anyone entering the machine is aware of the reduced level of protection and the additional hazards, including hot surfaces and intermittently moving parts.

. the machine cannot be started accidentally or otherwise, by posting warning signs and/or fitting appropriate anti–start devices.

Prior to attempting any maintenance work on a running machine, ensure that:

. the work carried out is limited to only those tasks which require the machine to run.

. the work carried out with safety protection devices disabled or removed is limited to only those tasks which require the machine to be running with safety protection devices disabled or removed.

. all hazards present are known (e.g. pressurised components, electrically live components, removed panels, covers and guards, extreme temperatures, inflow and outflow of air, intermittently moving parts, safety valve discharge etc.).

. appropriate personal protective equipment is worn.

. loose clothing, jewellery, long hair etc. is made safe.

. warning signs indicating that Maintenance Work is in Progress are posted in a position that can be clearly seen.

Upon completion of maintenance tasks and prior to returning the machine into service, ensure that:

. the machine is suitably tested.

. all guards and safety protection devices are refitted.

. all panels are replaced, canopy and doors closed.

. hazardous materials are effectively contained and disposed of.

PROTECTIVE SHUTDOWN SYSTEM

Comprises:

. Low engine oil pressure switch

. High discharge air temperature switch

. High engine water temperature switch

Low engine oil pressure switch.

At three month intervals, test the engine oil pressure switch circuit as follows:

. Start the machine.

. Remove a wire from one terminal of the switch. The machine should shutdown.

NOTE: Do not press the load button.

At twelve month intervals, test the engine oil pressure switch as follows:

. Remove the switch from the machine.

. Connect it to an independent low pressure supply (either air or oil).

. The switch should operate at 1,0 bar.

. Refit the switch.

Temperature switch(es).

At three month intervals, test the temperature switch circuit(s) as follows:

. Start the machine.

. Disconnect each switch in turn. The machine should shutdown.

. Re–connect the switch.

NOTE: Do not press the load button.

High discharge air temperature switch(es).

At twelve month intervals, test the air discharge temperature switch(es) by removing it from the machine and immersing in a bath of heated oil. The switch should operate at 120°C. Refit the switch.

High water temperature switch

At twelve month intervals, test the water temperature switch by removing it from the machine and immersing in a bath of heated oil. The switch should operate at 105°C. Refit the switch.

CAUTION: Never remove or replace switches when the machine is running.

SCAVENGE LINE

The scavenge line runs from the combined orifice/drop tube in the separator tank, to the orifice fitting located in the airend.
Examine the orifice, check valve and hoses at every service or in the event of oil carryover into the discharge air.

It is good preventative maintenance to check that the scavenge line and tube are clear of any obstruction each time the compressor lubricant is changed as any blockage will result in oil carryover into the discharge air.

COMPRESSOR OIL FILTER

Refer to the MAINTENANCE CHART in this section for the recommended servicing intervals.

Removal

WARNING: Do not remove the filter(s) without first making sure that the machine is stopped and the system has been completely relieved of all air pressure. (Refer to STOPPING THE UNIT in the OPERATING INSTRUCTIONS section of this manual).

Clean the exterior of the filter housing and remove the spin–on element by turning it in a counter–clockwise direction.

Inspection

Examine the filter element.

CAUTION: If there is any indication of the formation of varnishes, shellacs or lacquers on the filter element, it is a warning that the compressor lubricating and cooling oil has deteriorated and that it should be changed immediately. Refer to LUBRICATION later in this section.

Reassembly

Clean the filter gasket contact area and install the new element by screwing in a clockwise direction until the gasket makes contact with the filter housing. Tighten a further 1/2 to 3/4 of a revolution.

CAUTION: Start the machine (refer to PRIOR TO STARTING and STARTING THE UNIT in the OPERATING INSTRUCTIONS section of this manual) and check for leakage before the machine is put back into service.

COMPRESSOR OIL SEPARATOR ELEMENT

Normally the separator element will not require periodic maintenance provided that the air and oil filter elements are correctly maintained.

If, however, the element has to be replaced, then proceed as follows:

Removal

WARNING: Do not remove the filter(s) without first making sure that the machine is stopped and the system has been completely relieved of all air pressure. (Refer to STOPPING THE UNIT in the OPERATING INSTRUCTIONS section of this manual).

Disconnect all hoses and tubes from the separator tank cover plate. Remove the drop–tube from the separator tank cover plate and then remove the cover plate. Remove the separator element.

Inspection

Examine the filter element. Examine all hoses and tubes, and replace if necessary.

Reassembly

Thoroughly clean the orifice/drop tube and filter gasket contact area before reassembly. Install the new element.

WARNING: Do not remove the staple from the anti–static gasket on the separator element since it serves to ground any possible static build–up. Do not use gasket sealant since this will affect electrical conductance.

Reposition the cover plate, taking care not to damage the gasket, and replace the cover plate screws tightening in a criss–cross pattern to the recommended torque (refer to the TORQUE SETTING TABLE later in this section).

Engage the adaptor in the cover plate with the drop–tube integral with the filter, reconnect all hoses and tubes to the separator tank cover plate.

Replace the compressor oil (refer to LUBRICATION later in this section).

CAUTION: Start the machine (refer to PRIOR TO STARTING and STARTING THE UNIT in the OPERATING INSTRUCTIONS section of this manual) and check for leakage before the machine is put back into service.

COMPRESSOR OIL COOLER AND ENGINE RADIATOR

When grease, oil and dirt accumulate on the exterior surfaces of the oil cooler and radiator, the efficiency is impaired. It is recommended that each month the oil cooler and radiator be cleaned by directing a jet of compressed air, (carrying if possible a non–flammable cleaning solvent) over the exterior core of the cooler/radiator. This should remove any accumulation of oil, grease and dirt from the exterior core of the cooler so that the entire cooling area can radiate the heat of the lubricating and cooling oil/water into the air stream.

WARNING: Hot engine coolant and steam can cause injury. When adding coolant or antifreeze solution to the engine radiator, stop the engine at least one minute prior to releasing the radiator filler cap. Using a cloth to protect the hand, slowly release the filler cap, absorbing any released fluid with the cloth. Do not remove the filler cap until all excess fluid is released and the engine cooling system fully depressurised.

WARNING: Follow the instructions provided by the antifreeze supplier when adding or draining the antifreeze solution. It is advisable to wear personal protective equipment to prevent skin and eye contact with the antifreeze solution.
AIR FILTER ELEMENTS

The air filter should be inspected regularly (refer to the SERVICE/MAINTENANCE CHART) and the element replaced when the restriction indicator shows red or every 6 Months (500 hours), whichever comes first. The dust collector box(es) should be cleaned daily (more frequently in dusty operating conditions) and not allowed to become more than half full.

Removal

**CAUTION:** Never remove and replace element(s) when the machine is running.

Clean the exterior of the filter housing and remove the filter element by releasing the nut.

Inspection

Check for cracks, holes or any other damage to the element by holding it up to a light source, or by passing a lamp inside.

Check the seal at the end of the element and replace if any sign of damage is evident.

Reassembly

Assemble the new element into the filter housing ensuring that the seal seats properly.

Reset the restriction indicator by depressing the rubber diaphragm.

Assemble the dust collector box parts, ensuring that they are correctly positioned.

Before restarting the machine, check that all clamps are tight.

VENTILATION

Always check that the air inlets and outlets are clear of debris etc.

**CAUTION:** NEVER clean by blowing air inwards.

COOLING FAN DRIVE

Periodically check that the fan mounting bolts in the fan hub have not loosened. If, for any reason, it becomes necessary to remove the fan or re-tighten the fan mounting bolts, apply a good grade of commercially available thread locking compound to the bolt threads and tighten to the torque value shown in the TORQUE SETTING TABLE later in this section.

The fan belt(s) should be checked regularly for wear and correct tensioning.

FUEL SYSTEM

The fuel tank should be filled daily or every eight hours. To minimise condensation in the fuel tank(s), it is advisable to top up after the machine is shut down or at the end of each working day. At six month intervals drain any sediment or condensate that may have accumulated in the tank(s).

FUEL FILTER WATER SEPARATOR

The fuel filter water separator contains a filter element which should be replaced at regular intervals (see the SERVICE/MAINTENANCE CHART).

HOSES

All components of the engine cooling air intake system should be checked periodically to keep the engine at peak efficiency.

At the recommended intervals, (see the SERVICE/MAINTENANCE CHART), inspect all of the intake lines to the air filter, and all flexible hoses used for air lines, oil lines and fuel lines.

Periodically inspect all pipework for cracks, leaks, etc. and replace immediately if damaged.

ELECTRICAL SYSTEM

**WARNING:** Always disconnect the battery cables before performing any maintenance or service.

Inspect the safety shutdown system switches and the instrument panel relay contacts for evidence of arcing and pitting. Clean where necessary.

Check the mechanical action of the components.

Check the security of electrical terminals on the switches and relays i.e. nuts or screws loose, which may cause local hot spot oxidation.

Inspect the components and wiring for signs of overheating i.e. discolouration, charring of cables, deformation of parts, acrid smells and blistered paint.

BATTERY

Keep the battery terminals and cable clamps clean and lightly coated with petroleum jelly to prevent corrosion.

The retaining clamp should be kept tight enough to prevent the battery from moving.

PRESSURE SYSTEM

At 500 hour intervals it is necessary to inspect the external surfaces of the system (from the air end through to the discharge valve(s)) including hoses, tubes, tube fittings and the separator tank, for visible signs of impact damage, excessive corrosion, abrasion, tightness and chafing. Any suspect parts should be replaced before the machine is put back into service.

TYRES/TYRE PRESSURE

See the GENERAL INFORMATION section of this manual.

RUNNING GEAR/WHEELS

Check the wheel nut torque 20 miles (30 kilometres) after refitting the wheels. Refer to the TORQUE SETTING TABLE later in this section.

Lifting jacks should only be used under the axle.

The bolts securing the running gear to the chassis should be checked periodically for tightness (refer to the SERVICE/MAINTENANCE CHART for frequency) and re-tightened where necessary. Refer to the TORQUE SETTING TABLE later in this section.

BRAKES

Check and adjust the brake linkage at 500 miles (850Km) then every 3000 miles (5000Km) or 3 months (whichever is the sooner) to compensate for any stretch of the adjustable cables. Check and adjust the wheel brakes to compensate for wear.
WHEEL BRAKE ADJUSTMENT (M&E)

Ensure that the handbrake lever is fully released and that the coupling head is fully extended.

Each wheel brake must be adjusted in turn whilst rotating the wheel in the forward towing direction.

Refer to the diagram above.

1: Adjust the brakes until they lock-up by using adjuster A.

Release adjuster A until only a slight resistance is felt during wheel rotation.

Adjust nuts B and lock with the equaliser C parallel to the axle.

Take up the play with nut D behind the equaliser but without pre-loading the brakes (the wheels should rotate freely). Ensure that all locknuts are secured. The overrun lever play dimension E should not be greater than 14mm (fixed height running gear) or 16mm (variable height running gear). The spring free length dimension F should be 190mm.

2: When the unit is pushed backwards whilst parked, the brakes adopt their reverse mode and the spring store extends to maintain the parked condition. The handbrake will then feel less tensioned but the unit will remain stationary.
Adjusting the overrun braking system (KNOTT Running Gear)

1: Preparation
Jack up the machine
Disengage the handbrake lever [1].
Fully extend the draw bar [2] on the overrun braking system.

Requirements:
During the adjustment procedure always start with the wheel brakes.
Always rotate the wheel in the direction of forward movement.
Ensure that an M10 safety screw is fitted to the handbrake pivot.
The brake actuators must not be pre–tensioned – if necessary loosen
the brake linkage [7] on the brake equalisation assembly [8].

2. Brake Shoe Adjustment

Tighten adjusting screw [12] clockwise until the wheel locks.
Loosen adjusting screw [12] anti–clockwise (approx. ½ turn) until the
wheel can be moved freely.
Slight dragging noises that do not impede the free movement of the
wheel are permissible.
This adjustment procedure must be carried out as described on both
wheel brakes.
When the brake has been adjusted accurately the actuating distance
is approximately 5–8mm on the cable [11]

3: Compensator assembly adjustment

Variable Height models
Fit an M10 safety screw to the handbrake pivot.
Disconnect the handbrake cable [5] at one end.
Pre–adjust brake linkage [7] lengthways (a little play is permissible) and
re–insert the cable [5], adjusting it to give a small amount of play.
Remove the M10 safety screw from the handbrake pivot.

All Models
Engage the handbrake lever [1] and check that the position of the
equaliser plate [10] is at right angles to the pulling direction. If
necessary correct the position of the equaliser plate [10] on the cables
The compression spring [9] must only be slightly pre–tensioned and
when engaged must not touch the axle tube.
4: Brake linkage adjustment
Adjust the brake linkage [7] lengthways without pre–tension and without play in the transmission lever [4].

Readjustment
Engage the handbrake lever [1] forcefully a number of times to set the brake.
Check the alignment of the equalisation assembly [8], this should be at right angles to the pulling direction
Check the play in the brake linkage [7]
If necessary adjust the brake linkage [7] again without play and without pre–tensioning
There must still be a little play in cable [5] (Variable Height Only)
Check the position of the hand brake lever [1], The start of resistance should be approximately 10–15mm above the horizontal position.
Check that the wheels move freely when the handbrake is disengaged.

Final test
Check the fastenings on the transmission system (cables, brake equalisation system and linkage).
Check the handbrake cable [5] for a small amount of play and adjust if necessary (Variable height only)
Check the compression spring [9] for pre–tensioning.

Test run
If necessary carry out 2–3 test brake actions.

Test brake action
Check the play in brake linkage [7] and if necessary adjust the length of brake linkage [7] until there is no play.
Apply the handbrake while rolling the machine forward, travel of the handbrake lever up to 2/3 of maximum is allowed.

Re–adjusting the overrun braking system (KNOTT Running Gear)
Re–adjustment of the wheel brakes will compensate for brake lining wear. Follow the procedure described in 2: Brake Shoe Adjustment.
Check the play in the brake linkage [7] and re–adjust if necessary.

Important
Check the brake actuators and cables [11]. The brake actuators must not be pre–tensioned.
Excessive operation of the handbrake lever, which may have been caused by worn brake linings, must not be corrected by re–adjusting (shortening) the brake linkage [7]

Re–adjustment
The handbrake lever [1] should be engaged forcefully several times to set the braking system.
Check the setting of the brake equalisation assembly [8], which should be at right angles to the pulling direction.
Check the play in the brake linkage [7] again, ensuring that there is no play in the brake linkage and that it is adjusted without pre–tension
Check the position of the hand brake lever [1], cable [5] (with little play) and the compression spring [9] (only slight pre–tension). The start of resistance of the handbrake lever should be approximately 10–15mm above the horizontal position.

Final test
Check the fastenings on the transmission system (cables, brake equalisation system and linkage).
Apply the handbrake while rolling the machine forward, travel of the handbrake lever up to 2/3 of maximum is allowed.
Check the handbrake cable [5] for a small amount of play and adjust if necessary (Variable height only)
Check the compression spring [9] for slight pre–tensioning.

CAUTION: Check the wheel nut torque 20 miles (30 kilometres) after refitting the wheels (Refer to the TORQUE SETTING TABLE later in this section).

LUBRICATION
The engine is initially supplied with engine oil sufficient for a nominal period of operation (for more information, consult the Engine section of this manual).

CAUTION: Always check the oil levels before a new machine is put into service.

If, for any reason, the unit has been drained, it must be re–filled with new oil before it is put into operation.

ENGINE LUBRICATING OIL
The engine oil should be changed at the engine manufacturer’s recommended intervals. Refer to the Engine section of this manual.

ENGINE LUBRICATING OIL SPECIFICATION
Refer to the Engine section of this manual.

ENGINE OIL FILTER ELEMENT
The engine oil filter element should be changed at the engine manufacturer’s recommended intervals. Refer to the Engine section of this manual.

COMPRESSOR LUBRICATING OIL
Refer to the SERVICE/MAINTENANCE CHART in this section for service intervals.

NOTE: If the machine has been operating under adverse conditions, or has suffered long shutdown periods, then more frequent service intervals will be required.

WARNING: DO NOT, under any circumstances, remove any drain plugs or the oil filler plug from the compressor lubricating and cooling system without first making sure that the machine is stopped and the system has been completely relieved of all air pressure (refer to STOPPING THE UNIT in the OPERATING INSTRUCTIONS section of this manual).

Completely drain the receiver/separator system including the piping and oil cooler by removing the drain plug(s) and collecting the used oil in a suitable container.

Replace the drain plug(s) ensuring that each one is secure.
NOTE: If the oil is drained immediately after the machine has been running, then most of the sediment will be in suspension and will therefore drain more readily.

CAUTION: Some oil mixtures are incompatible and result in the formation of varnishes, shellacs or lacquers which may be insoluble.

NOTE: Always specify INGERSOLL–RAND Pro–Tec™ oil for use at all ambient temperatures above –23°C.

COMPRESSOR OIL FILTER ELEMENT

Refer to the SERVICE / MAINTENANCE CHART in this section for service intervals.

RUNNING GEAR WHEEL BEARINGS

Wheel bearings should be packed with grease every 6 months. The type of grease used should conform to specification MIL–G–10924.

SPEED AND PRESSURE REGULATION ADJUSTMENT

Normally, regulation requires no adjusting, but if correct adjustment is lost, proceed as follows:

Refer to the diagram above.

A: Throttle arm
B: Adjusting screw

Start the machine (Refer to STARTING INSTRUCTIONS in the OPERATING INSTRUCTIONS section of this manual).

Inspect the throttle arm on the engine governor to see that it is extended in the full speed position when the engine is running at full–load speed and the service valve is fully open. (Refer to the GENERAL INFORMATION section of this manual).

Adjust the service valve on the outside of the machine to maintain 7 bar without the throttle arm moving from the full speed position. If the throttle arm moves away from the full speed position before 7 bar is attained, then turn the adjusting screw clockwise to increase the pressure. Optimum adjustment is achieved when the throttle arm just moves from its full speed position and the pressure gauge reads 7,2 bar.

Close the service valve. The engine will slow to idle speed.

CAUTION: Never allow the idle pressure to exceed 8,6 bar on the pressure gauge, otherwise the safety valve will operate.

LUBRICATOR

SAFETY

WARNING: Ensure that the lubricator filler cap is re–tightened correctly after replenishing with oil.

WARNING: Do not replenish the lubricator oil, or service the lubricator without first making sure that the machine is stopped and the system has been completely relieved of all air pressure (Refer to STOPPING THE UNIT in the OPERATING INSTRUCTIONS section of this manual).

CAUTION: If the nylon tubes to the lubricator are disconnected then ensure that each tube is re–connected in its original location.

GENERAL INFORMATION

Oil capacity: 2 litres

Oil specification: Refer to the Tool Manufacturer’s Manual.

OPERATING INSTRUCTIONS

COMMISSIONING

Check the lubricator oil level and fill as necessary.

PRIOR TO STARTING

Check the lubricator oil level and replenish as necessary.

MAINTENANCE

Check the lubricator oil level and replenish as necessary.

The INGERSOLL–RAND industrial diesel engines are a product of long years of experience, advanced technology, and up-to-date production facilities. INGERSOLL–RAND takes great pride in the superior durability and operating economy of these engines.

In order to get the fullest use and benefit from your engine, it is important that you operate and maintain it correctly. This Manual is designed to help you do this.

Please read this Manual carefully and follow its operating and maintenance recommendations. This will ensure many years of trouble-free and economical engine operation.

Should your engine require servicing, please contact your nearest INGERSOLL–RAND branch or distributor.

All information, illustrations, and specifications contained in this Manual are based on the latest product information available at the time of publication.

INGERSOLL–RAND reserves the right to make changes in this Manual at any time without prior notice.

ENGINE IDENTIFICATION

Serial No Location

The engine serial number is stamped on the front upper right side of the cylinder body.

Confirmation of Engine Number

It is advisable to quote the engine serial number together with the machine serial number, as it is required when you contact the Ingersoll–Rand branch or distributor for repair, service or parts ordering.

INGERSOLL–RAND ENGINE AFTER SALES SUPPORT

Ingersoll–Rand Engine After Sales Service

Please feel free to contact your Ingersoll–Rand branch or distributor for periodical inspection and maintenance.

Ingersoll–Rand Genuine Parts

Genuine Ingersoll–Rand parts are identical with those used in the engine production, and accordingly, they are warranted by Ingersoll–Rand.

Genuine Ingersoll–Rand parts are supplied by your Ingersoll–Rand branch or distributor.

Please ensure that only genuine Ingersoll–Rand parts, lubricants and fluids are used for service and/or repair.

Fig. 3

B. Engine serial number
FUEL

Fuel Selection

The following properties are required of the diesel fuel.

- Must be free from minute dust particles.
- Must have adequate viscosity.
- Must have high cetane value.
- Must have high fluidity at low temperature.
- Must have low sulphur content.
- Must have little residual carbon.

It is strongly advisable to use ASTM D975 No. 2D (the general automotive diesel engine purpose fuel oil) or equivalent which fully meets the above requirements.

Applicable Standard | Recommendation

BS (BRITISH STANDARD) Based on BS/2869–1970 | Class A–1

FUEL REQUIREMENTS

Notice: the fuel injection pump, injector or other parts of the fuel system and engine can be damaged if you use any fuel or fuel additive other than those specifically recommended by Ingersoll–Rand.

NOTE: If any fuel other than the one specified is used, engine operation will be impaired. Engine failure or malfunction resulting from use of such improper fuel will not be warranted by Ingersoll–Rand.

To help avoid fuel system or engine damage, please read the following:

Do not use diesel fuel which has been contaminated with engine oil. Besides causing engine damage, such fuel can also affect emission control. Before using any diesel fuel, check with the fuel supplier to see if the fuel has been mixed with engine oil.

Your engine is designed to use either Number 1–D or Number 2–D diesel fuel. However, for better fuel economy, use Number 2–D diesel fuel whenever possible. At temperatures less than –7°C (20°F), Number 2–D fuel may pose operating problems (see “Cold Weather Operation” which follows). At colder temperatures, use Number 1–D fuel (if available) or use a “winterized” Number 2–D (a blend of Number 1–D and Number 2–D). This blended fuel is usually called Number 2–D also, but can be used in colder temperatures than Number 2–D fuel which has not been “winterized.”

Check with the fuel supplier to be sure you get the properly blended fuel.

NOTE: Do not use home heating oil or gasoline in your diesel engine; either may cause engine damage.

Handling of the Fuel

Any fuel containing dust particles or water might cause engine failure.

Therefore, the following must be observed.

- Take care to protect the fuel from ingress of dust particles or water when filling the fuel tank.

If refuelling is done from an oil drum directly, ensure that it has been kept stationary to allow any dust, sediment or water to settle at the bottom. Do not draw fuel direct from the bottom of the drum to prevent pickup of any settled foreign material.

Always fully fill the fuel tank. Drain the sedimented particles in the fuel tank frequently.

Water in Fuel

During refueling, it is possible for water (and other contaminants) to be pumped into your fuel tank along with the diesel fuel. This can happen if a fuel provider does not regularly inspect and clean its fuel tanks, or receives contaminated fuel from its supplier(s). To protect your engine from contaminated fuel, there is a fuel filter system on the engine which allows you to drain excess water.

CAUTION: The water/diesel fuel mixture is flammable, and could be hot. To avoid personal injury and/or property damage, do not touch the fuel coming from the drain valve, and do not expose the fuel to open flames or sparks.

Be sure you do not overfill the fuel tank. Heat (such as from the engine) can cause the fuel to expand. If the tank is too full, fuel could be forced out. This could lead to a fire and the risk of personal injury and/or equipment damage.

Biocides

In warm or humid weather, fungus and/or bacteria may form in diesel fuel if there is water in the fuel.

NOTE: Fungus or bacteria can cause fuel system damage by plugging the fuel lines, fuel filters or injector. They can also cause fuel system corrosion.

If fungus or bacteria has caused fuel system problems, you should have your authorized dealer correct these problems. Then, use a diesel fuel biocide to sterilize the fuel system (follow the biocide manufacturer’s instructions). Biocides are available from your dealer, service stations, parts stores and other automotive places. See your authorized dealer for advice on using biocides in your area and for recommendations on which biocides you should use.

Smoke Suppressants

The use of a smoke suppressant additive is not allowed because of the greater possibility of stuck rings and valve failure, resulting from excessive ash deposits.
LUBRICANT.

The quality of engine oil can affect engine performance, startability and engine life.

Use of unsuitable engine oil will result in piston ring, piston and cylinder seizure and accelerate surface wear causing increased oil consumption, lowered output and, finally engine failure. To avoid this, use the specified engine oil.

1) Engine Oil Selection

**Pro Tec™**

2) Oil Viscosity

Engine oil viscosity affects engine startability, performance, oil consumption, wear and the potential for seizure, etc. Always ensure that lubricants with the correct viscosity for the operating temperature are used. Refer to fig 4.

**NOTE**

Using a mixture of different brands or quality of oils will adversely affect the original oil quality; therefore, never mix different brand or different type oils.

Do not use API, CA, CB grade and reconstituted engine oil

Engine damage due to improper maintenance, or using oil of the improper quality and/or viscosity, is not covered by the warranty.

---

**COOLANT**

All Ingersoll–Rand portable compressor engines are factory filled with a 50/50 Ethylene glycol base antifreeze/water mix, which provides protection to –33°C (–27°F)
ENGINE OPERATION

Engine Exhaust Gas Caution (Carbon Monoxide)

CAUTION
Do not breathe exhaust gas because it contains carbon monoxide, which by itself has no color or odor. Carbon monoxide is a dangerous gas. It can cause unconsciousness and can be lethal.

Do not run the engine in confined areas (such as garages or next to a building). Keep the exhaust tailpipe area clear of snow and other material to help reduce the buildup of exhaust gases under the equipment. This is particularly important when parked in blizzard conditions.

CHECK BEFORE OPERATION

CAUTION: For safety reasons, conduct the inspection with the engine stopped.

Engine Oil Level.

Place the engine or the machine on a level surface

Remove the dipstick, wipe it with a cloth. Insert it fully and take it out gently again.

Check the oil level against the marks on the dipstick. The oil level must be between the “Max” level mark and the “Min” level mark as illustrated.

A Dipstick

A Max. level
B Min. level

Also check the sample oil on the dipstick for contamination and viscosity.
Take care not to add too much engine oil

Oil can be poured either through the oil filler at the front of the cylinder head cover or through the oil filler on the right side of the timing gear case.

A Oil filler cap

A certain period of time is required before the engine oil completely flows down from the oil filler to the crankcase. Wait at least ten minutes before checking the oil level.

NOTE: Take care to avoid engine oil being splashed on the fan drive belt because it causes belt slippage or slackness.

CAUTION: When adding oil, take care not to spill it. If you spill oil on the engine or equipment, wipe it properly, to prevent the risk of fire and personal injury and/or equipment damage.

Fan Belt Check

Check the fan belt for tension and abnormalities.

When the belt is depressed 8 – 10 mm with the thumb (about 100 N [10 kg] pressure) midway between the fan pulley and alternator pulley, the belt tension is correct.

If the belt tension is too high, it will result in alternator failure.

A loose belt will cause belt slippage which may result in a damaged belt, abnormal noise, poor battery charging and engine overheating.

Coolant Level Check

The coolant level must be between “MAX COLD” and “MIN” marks on the reserve tank depending on the temperature of the engine. Check and ensure that the level is correct.

CAUTION: When removing the radiator filler cap, while the engine is still hot, cover the cap with cloth, then turn it slowly to gradually release the internal steam pressure. this will prevent anyone from being scalded by hot steam spurtling out from the filler neck.

Add coolant mixed to the correct ratio: 50/50 ethylene glycol/water.
Radiator Cap Condition
After the replenishment of the coolant, install the radiator filler cap. Make sure the cap is securely installed.

Battery Cable Connection
Check the battery cable connections for looseness or corrosion. A loosened cable connection will result in hard engine starting or insufficient battery charge. The battery cables must be tightened securely. Never reverse “+” and “−” terminals when reconnecting cables after disconnection. Even a short period of reverse connection will damage the electrical parts.

Battery Electrolyte level
The amount of electrolyte in the batteries will be reduced after repeated discharge and recharge. Check the electrolyte level in the batteries, replenish with a commercially available electrolyte such as distilled water, if necessary. The battery electrolyte level checking procedure will vary with battery type. NOTICE: Do not replenish with dilute sulfuric acid in the daily service.

CAUTION:
When inspecting the batteries, be sure to stop the engine first.
As dilute sulphuric acid is used as electrolyte, be careful not to contaminate your eyes, hands, clothes, and metals with the electrolyte. If it gets in your eye, wash with a large amount of water at once, then seek medical advice.

As highly flammable hydrogen gas is released from the batteries, do not create a spark or allow any naked flame near the batteries.

When handling such metallic articles as tools near the batteries, be sure not to contact the “−” terminal because the compressor body is “−” and a dangerous short circuit might result.

When disconnecting the terminals, start with “−” terminal. When connecting them, connect the “−” terminal last.

CHECKS AND OPERATION AFTER START–UP

Check after the Engine Start–up
Check the following items in the engine warming–up operation.

Engine oil pressure –
The engine oil pressure gauge readings (where fitted) may vary depending on ambient temperature and type of oil. The gauge should register around 55 to 85 psi in the warming–up period.

Engine noise and exhaust smoke color –
Listen to the engine and, if any abnormal noise is heard, check to determine the cause.

Check the fuel combustion condition by observing the exhaust smoke color. The exhaust smoke color after engine warm–up and at no–load condition should be colorless or light blue.

Black or white smoke indicates incorrect combustion.

Note: After start–up from cold the engine might be noisier and the exhaust smoke color darker than when it has warmed up. However this condition will disappear after warm up.

Leakage in the systems –
Check the following items:

Lubrication oil leakage –
Check the engine for oil leaks, paying particular attention to oil filter and oil pipe joints.

Fuel leakage –
Check the fuel injection pump, fuel lines and fuel filter for leakage.

Coolant leakage – Check the radiator and water pump hose connections and the water drain cock on the cylinder block for leakage.

Exhaust smoke or gas leakage

Checking coolant level
The coolant level could drop because any mixed air is expelled in about 5 minutes after the engine started.

Stop the engine, remove radiator cap, and add coolant.

CAUTION: Hot steam can rush out and you could get burnt if the radiator cap is removed when the engine is hot. Cover the radiator cap with a thick cloth and loosen the cap slowly to reduce the pressure, then remove the cap.
OPERATION AND CARE OF A NEW ENGINE.

Your Ingersoll–Rand engine is carefully tested and adjusted in the factory, however, further run-in is necessary. Avoid any harsh engine operation within the initial 100 operating hours.

Do not operate the unit at full load until the engine is warmed-up.

Do not allow the engine to run unloaded for extended periods so as to minimise the risk of cylinder bore glazing.

During operation, pay attention to the following points if the engine shows any sign of abnormalities.

1) Engine Oil Pressure – The engine oil pressure is monitored by a switch that will stop the engine if the pressure falls below a pre-set value. When the engine is running at normal temperature and conditions, the oil pressure gauge (where fitted) should show 30 to 50 psi. Note: This figure only applies to the P135 running at constant speed. If the oil pressure gauge shows below 30 psi or if the reading fluctuates continually, stop the engine and check the oil level. If the level is correct, contact your local Ingersoll–Rand branch or dealer to establish the cause.

2) Coolant Temperature – The engine performance will be adversely affected if engine coolant temperature is too hot or too cold. The normal coolant temperature is 75 to 85°C (167 to 185°F).

Overheating

CAUTION: If you see or hear escaping steam or have other reason to suspect there is a serious overheat condition, stop the engine immediately.

If the Engine Coolant Temperature gage (where fitted) shows an overheat condition, or you have reason to suspect the engine may be overheating, take the following step:

- Close the service valve to reduce the load.
- Let the engine run at normal idle speed for two or three minutes. If the engine coolant temperature does not start to drop, turn off the engine and proceed as follows:

  CAUTION: To help avoid being burned –

  • Do not open the canopy or door if you see or hear steam or engine coolant escaping. Wait until no steam or engine coolant can be seen or heard before opening the engine canopy or door.
  • Do not remove the radiator filler cap if the engine coolant in the reserve tank is boiling. Also do not remove the radiator filler cap while the engine and radiator are still hot. Scalding fluid and steam can be blown out under pressure if either cap is taken off too soon.

If no steam or engine coolant can be seen or heard, open the canopy or door. If the engine coolant is boiling, wait until it stops before proceeding. The engine coolant level should be between the “MAX COLD” and “MIN” marks on the reserve tank.

Make sure the fan belt is not broken, or off the pulley, and that the fan turns when the engine is started. If the engine coolant level in the reserve tank is low, look for leaks at the radiator hoses and connections, radiator, and water pump. If you find major leaks, do not run the engine until these problems have been corrected. If you do not find a leak or other problem, WAIT UNTIL THE ENGINE HAS COOLED DOWN then carefully add engine coolant to the reserve tank.

(Engine coolant is a mixture of ethylene glycol antifreeze and water. See “Engine Care in cold season” for the proper antifreeze and mixture.)

CAUTION: To avoid being burned, do not spill antifreeze or engine coolant on the exhaust system or hot engine parts. Under some conditions the ethylene glycol in engine coolant is combustible.

If the engine coolant level in the reserve tank is at the correct level but there is still an indication of an overheat condition and no cause was found, please consult your local Ingersoll–Rand branch or dealer.

Overcooling

Operating the engine at low coolant temperature will not only increase the oil and fuel consumption but also will lead to premature parts wear which may result in engine failure. Ensure that the engine reaches normal operating temperature 75 to 85°C (167 to 185°F) within ten minutes of starting.

3) Hourmeter

This meter indicates the machine operation hours. Make sure that the meter is always working during engine operation. Periodical machine maintenance is scheduled on the operation hours indicated on the hourmeter.

4) Liquid and Exhaust Smoke Leakage

Make regular checks for lubricant, fuel, coolant and exhaust smoke leakage.

5) Abnormal Engine Noise

In the event of any abnormal engine noise, please consult your local Ingersoll–Rand branch or dealer.

6) State of the Exhaust Smoke

Check for any abnormal exhaust smoke color.

ENGINE STOPPING

(1) Close service valves.

(2) Before stopping the engine, cool down the engine by operating it at reduced load about three minutes. In this period, check the engine noise and the engine oil pressure (where a gage is fitted) for abnormalities.

LONG TERM STORAGE

If the equipment is to be out of operation for an extended period, it should be started at least once per week and run on load for about 15 minutes after it has reached normal operating temperature.
LUBRICATING SYSTEM.
Servicing of the engine oil and oil filter element will affect the engine performance as well as the engine life. Change the engine oil and the oil filter in accordance with the recommended service intervals.

Engine Oil and Oil Filter Element Change.

Engine Oil Change and Oil Filter Element Change must be made simultaneously according to the following change schedule.

Change intervals:
- Engine Oil – every 250 operating hours or 3 months, whichever comes first.
- Oil Filter Element – every 250 operating hours or 3 months, whichever comes first.

Engine Oil draining –
**CAUTION:** To help avoid the risk of being burned, do not drain oil while the engine is still hot.
Wipe clean around the oil filler cap taking care so that no foreign particles enter. Remove the filler cap.
It is advisable that draining be done while the engine is warm to minimize the draining time.

Remove the oil pan drain plug and drain the engine oil completely.
**NOTICE:** Use a receptacle to catch the drained oil so that the engine and equipment will not be contaminated.

**Oil filter element removal**
Use a filter wrench to remove the cartridge type oil filter element taking care to prevent any oil spillage into the enclosure.

**Oil filter element installation –**
Lightly apply engine oil to the O-ring.
Screw in the new cartridge hand tight as the O-ring comes in contact with the engine block.
Use a filter wrench to further screw in the cartridge by 3/4 turn.

**Engine oil refilling.**
Reinstall the drain plug.

Fill with new engine oil via the most convenient oil filler port.
Wait at least ten minutes until the oil drains down to the oil pan. Then check the oil level with the dipstick.

**Check after Oil and Filter Changes.**
**Oil leakage check:**
Run the unit for five to ten minutes, then visually check for oil leakage.
**Oil level recheck:**
Stop the engine for at least ten minutes.
Use the dipstick to recheck the oil level. If necessary replenish with engine oil to the specified level.

**NOTE:** When the engine is started, the oil level will slightly drop from the initial level as the oil fills the entire oil circuit.
Engine Oil Additives

Engine oils contain a variety of additives. Your engine should not need any extra additives if you use the recommended oil quality and change intervals.

Used Oil Disposal – Do not dispose of used engine oil (or any other oil) in a careless manner such as pouring it on the ground, into sewers, or into streams or bodies of water. Instead, recycle it by taking it to a used oil collection facility which may be found in your community. If you have a problem disposing of your used oil, it is suggested that you contact your local Ingersoll–Rand branch or dealer. This also applies to diesel fuel which is contaminated with water.

Used Engine Oil

CAUTION: Used engine oil contains harmful contaminants that have caused skin cancer in laboratory animals. Avoid prolonged skin contact. Clean skin and nails thoroughly using soap and water –not mineral oil, fuels, or solvents. Launder or discard clothing, shoes, or rags containing used engine oil.

Discard used engine oil and other oils properly.

COOLING SYSTEM

Fan Belt Tension Adjustment

Adjust fan belt tension when belt slackness is greater than the specified amount and when the belts are replaced.

CAUTION: To help avoid being injured, check and adjust fan belt tension with engine stopped.

When the belt is depressed 8 – 10 mm with the thumb (about 100 N [10 kg] pressure) midway between the fan pulley and alternator pulley, the belt tension is correct.

![Fig. 12](image)

- A Mounting bolts
- B Adjusting bolt

Adjusting procedure.

- Belt tension adjustment is made by pivoting the alternator at the alternator mounting bolt.
- Loosen the three alternator mounting bolts (A).
- Pivot the alternator at the mounting bolt toward or away from the engine as required using the adjusting bolt (B).
- Tighten the three mounting bolts (A).

NOTE: Belt tension may slightly vary after the alternator is fixed. Therefore, recheck the belt tension after tightening the bolts.

After the adjustment, operate the engine for about five minutes at a low idle speed, stop the engine and recheck the belt tension. Pay particular attention to this when installing a new belt. Belt tension may vary initially due to the belt bedding in.

Use of Genuine Ingersoll–Rand Fan Belt.

Always use Genuine Ingersoll–Rand fan belts as they provide high driving ability and long operating durability. Use of non–Ingersoll–Rand fan belts could result in premature belt wear or belt elongation leading to engine overheating or excessive belt noise.

Coolant Change

The coolant must be changed at intervals of 1000 hours or twelve months, whichever come first.

If the coolant becomes sludged up it will lead to engine overheating or coolant blow–off from the radiator.

Coolant draining.

WARNING: Hot engine coolant and steam can cause injury. When adding to or draining coolant or antifreeze solution from the engine radiator, stop the engine at least one minute prior to releasing the radiator filler cap. Using a cloth to protect the hand, slowly release the filler cap, absorbing any released fluid with the cloth. Do not remove the filler cap until all excess fluid is released and the engine cooling system fully depressurised.

WARNING: Follow the instructions provided by the antifreeze supplier when adding or draining the antifreeze solution. It is advisable to wear personal protective equipment to prevent skin and eye contact with the antifreeze solution.

- Remove the radiator cap.
- Slacken the bottom radiator hose clamp to drain the coolant from the radiator.

![Fig. 13](image)

- A Cylinder block water drain plug

Drain the coolant from the engine block by loosening the water drain plug (A fig. 13) on the left side of cylinder block behind the alternator.
PERIODICAL INSPECTION AND MAINTENANCE.

Filling with coolant

Ensure that the engine is cool.

Close the coolant drain plug and tighten the bottom hose clamp.

Use clean water mixed 50/50 with antifreeze as a coolant. Fill up the radiator with the coolant until the level comes up to the "MAX COLD" mark on the reserve tank.

Fill slowly to prevent air entering the cooling system.

For Coolant volume, refer to "General Information section".

When the system has been filled, operate the engine about five minutes at a low idle speed, then as the air contained in the coolant circuit is bled off the coolant level will drop.

Stop the engine and replenish with the correct coolant mix.

Cleaning outside of Radiator

Debris, mud or dried grass caught between radiator fins will block the air flow, resulting in lower cooling efficiency. Clean the radiator fins with steam or low pressure (< 5 Bar) compressed air every 250 hours or 3 months (whichever comes first) or more frequently in adverse operating conditions.

Cooling System Circuit Cleaning

When the cooling system circuit is contaminated with water scales or sludge particles, cooling efficiency will be lowered. Periodically clean the circuit interior with a suitable cleaner.

Clean the cooling system circuit every 1000 operating hours or 12 months, whichever comes first.

FUEL SYSTEM

The fuel injection pump and injector nozzles are precisely manufactured, and therefore, using fuel which contains water or dust particles will result in either injection pump plunger seizure or injector nozzle seizure. A fuel filter element blocked with sludge or dust particles will lead to reduced engine output.

Perform inspection and maintenance periodically as follows:

Draining Water from Fuel Filter/separator.

The fuel filter/separator is provided to allow water to be drained from the fuel system. Water is heavier than fuel so any water contained in the system will collect in the bottom of the bowl.

The clear bowl 'D' should be checked on a daily basis and if water is present, it should be drained from the separator.

Place a suitable container under the separator to prevent any spillage inside the machine.

Slacken the drain valve ‘E’ until water drains from the vent tube.

When all the water has been evacuated, tighten the drain valve ‘E’ and follow the "fuel system air bleeding" procedure below.

Fuel filter/separator element change.

NOTE:
The cartridge and bowl contain fuel. Take care not to spill it during disassembly and reassembly.

The fuel filter/separator also provides primary filtration and the element 'C' should be changed every 500 operating hours or 6 months, whichever comes first.

Change procedure:

Unscrew the element ‘C’ from the head taking care not to spill fuel inside the machine. Drain any fuel within into a suitable container, then unscrew the clear bowl ‘D’ from the element.

Discard the old element into a suitable container.

Remove the old ‘O’ ring from the bowl ‘D’ and install the new one supplied with the element. Apply a light coat of clean engine oil to the ‘O’ ring and screw the bowl ‘D’ onto the new element ‘C’.

Using a clean cloth, wipe the sealing face of the filter/separator head to ensure correct seating of the sealing ring.

Fill the element/bowl assembly with clean fuel oil then apply a light coat of clean engine oil to the new element seal ring.

Screw the new element onto the head firmly by hand.

Follow the "fuel system air bleeding" procedure below.

Secondary fuel filter

A Cartridge element

The element should be changed every 500 operating hours or 6 months, whichever comes first.
Change procedure:

Unscrew the element from the filter head taking care not to spill fuel inside the machine. Discard the old element into a suitable container.

Using a clean rag, wipe the sealing face of the filter head to ensure correct seating of the sealing ring.

Fill the new element with clean fuel oil then apply a light coat of clean engine oil to the sealing ring.

Screw the new element onto the head firmly by hand

Follow the “fuel system air bleeding” procedure below.

Fuel System Air Bleeding

The entry of air into the fuel system will cause difficult engine starting or engine malfunction.

When carrying out service procedures such as emptying the fuel tank, draining the filter/separator, and changing the fuel filter element, be sure to bleed air from the fuel system.

To activate the “automatic air-bleeding system”, turn the key switch to the “ON” position and energise the “electromagnetic pump” to bleed the air.

Air bleeding method:

When the “starter switch” is set to the “ON” position to activate the electromagnetic pump, fuel is forced to the fuel valve of each injection pump and then to the leak-off pipe of each injector nozzle, so that any air in the fuel system bleeds off automatically to the fuel tank.

NOTE:
Although the fuel system can bleed air automatically when the key switch is in the “ON” position, air can also be manually bled by use of the primer pump facility in the filter/separator assembly. By unscrewing the plastic primer pump head ‘A’ and stroking it up and down, any air bubbles in the system will be purged back to the fuel tank. When this has been completed, the pump head must be screwed back into the filter/separator assembly.

Start the engine and visually check the fuel system for leaks.

Governor Control Seals

As the governor is precisely adjusted, most of the controls are sealed, please do not break them. Should any adjustment be necessary, contact your local Ingersoll–Rand branch or distributor.

NOTE: Ingersoll–Rand will not accept any warranty claim on an engine with broken governor seals.
AIR INTAKE SYSTEM

Air cleaner

Engine performance and life vary with the air intake conditions.

A dirty air cleaner element reduces the amount of intake air, causing reduced engine output and possible engine damage.

Also, a damaged element leads to abrasion of cylinders and valves, resulting in increased oil consumption, reduced output and shortened engine life.

The filter element should be changed at 500 hours or 6 months, whichever comes first, or sooner if the restriction indicator shows red. See below.

ENGINE ELECTRICAL

The Ingersoll–Rand engines uses a 12 volt system and a negative grounding for the electrical system.

Battery Servicing

Battery terminal connections

- Check the battery cable connections for looseness or corrosion. Poor cable connections will result in difficult engine starting or insufficient battery charge.
- The battery cables must be tightened securely.
- Never reverse “+” and “−” terminals when reconnecting cables after removal. Even a short period of reverse connection will damage the electrical parts.

Cleaning of Battery

When the battery terminals are fouled clean them with clean tepid water and wipe with a dry cloth to remove the water. Apply a light coat of vaseline or a grease.

Alternator Servicing

The polarity of the alternator is negative (−) grounding type.

Do not reverse the polarity connection, otherwise a short circuit will occur resulting in alternator failure.

Do not put water directly on the alternator. Entry of water into the alternator creates electrolytic corrosion causing failure.

When the battery is charged from an external source, be sure to disconnect the battery cables.

Wiring Connections

Check all of the electric wiring connections for looseness and damage on a regular basis.

SERVICE AND MAINTENANCE

Please refer to the engine maintenance schedule.

For continued trouble free engine operation throughout its life, the service procedures marked with an asterisk (*) need to be carried out by a skilled and trained technician.

Please consult your local Ingersoll–Rand branch or dealer when these procedures become due.

Please also read the note referring to the service items marked with the star ★ symbol.
FUEL SELECTION

In cold weather, the fuel might freeze resulting in difficult engine starting; therefore, select a suitable fuel for such engine operation. Use ASTM 975 No. 2–D fuel if you expect temperature above 20°F (–7°C).

Use Number 1–D if you expect temperatures below 20°F (–7°C).

If Number 1–D is not available, a “winter” blend of 1–D and 2–D is available in some areas during the winter months.

Check with your fuel supplier to be sure you get the correct blended fuel.

COOLANT

Where the ambient temperature falls below freezing point, the cooling system should be drained after engine operation, but to eliminate the need for repeated draining, refilling and to provide all year protection against corrosion, the use of anti-freeze solution throughout the year is highly recommended.

All Ingersoll–Rand portable compressor engines are factory filled with a 50/50 Ethylene glycol base antifreeze/water mix. which provides protection to –33°C (–27°F)

Concentrations over about 65% adversely affect freeze protection, heat transfer rates, and silicate stability which may cause water pump leakage.

CAUTION:

Never exceed a 60/40 antifreeze/water mix. (which provides protection to about–50°C (–58°F).)

NOTE:

Methyl alcohol base antifreeze is not recommended because of its effect on the non–metallic components of the cooling system and because of its low boiling point.

NOTE:

High silicate antifreeze is not recommended because of causing serious silica gelation problems.

NOTE:

Usage and mixing ratio etc. should be followed to the antifreeze manufacture's recommendations.

ENGINE OIL

At low ambient temperatures, engine oil viscosity can affect engine starting. It is important to use the correct grade of oil as recommended in fig 4.

Try to position the compressor where it will not be affected by cold winds when not running.

BATTERY

(1) Always ensure that the batteries are kept fully charged in the cold season. This takes a longer period of running than in warm weather operation.

The electrolyte in a partly discharged battery will freeze easier than when it is fully charged. Try to keep the batteries fully charged and warm in cold weather operation.

(2) Top up the battery with distilled water immediately before starting the engine.

COLD STARTING

When operating in cold ambient conditions, or when starting from cold, observe the following procedures:

Turn the key switch to the number 2 position and hold for between 5 and 8 seconds. This action operates the glow plugs.

If the engine does not start at the first attempt, allow the battery to recover for at least 30 seconds then repeat step 1) above.

In order to protect the starter, do not engage for longer than 10 seconds during any attempt.

If during cranking, the starter motor repeatedly engages and disengages the battery power could be low. Either recharge the battery or replace it with one that is fully charged.

NOTICE: Do not use starting “aids” in the air intake system. Such aids can cause immediate engine damage.
When performing the following items, the daily inspection items should also be carried out.

**Note:**
1. After every 1000 hours of operation, the service intervals should be repeated in accordance with this check and maintenance schedule.
2. When servicing on the asterisked (*) items is necessary, consult your local Ingersoll–Rand branch or distributor.
Note:
★ This is a recommended maintenance item. The failure to perform this maintenance item will not nullify the emission warranty or limit recall liability prior to the completion engine useful life. Ingersoll–Rand, however, urges that recommended maintenance service is performed at the indicated intervals.

EXPLANATION OF MAINTENANCE SCHEDULE
The following is a brief explanation of the services listed in the preceding Engine Maintenance schedule.

1. **Oil level.**
   - Check that the oil level is between the max. and the min. level marks.
   - Add oil to the max. level mark if it is below the min. level.
   - If it is above the max. level mark, drain oil until the max. level is reached.

2. **Oil leakage check**
   - Replace any damaged or malfunctioning parts which could cause leakage.

3. **Engine oil replacement**
   - Change at 250 hours or 3 months, whichever comes first.

4. **Oil filter element replacement**
   - Change at 250 hours or 3 months, whichever comes first.

5. **Fuel leakage**
   - Replace any damaged or malfunctioning parts which could cause leakage.

6. **Draining water in fuel filter/separator.**
   - Drain off water in the fuel filter/separator bowl.

7. **Fuel filter element replacement**
   - Replace both primary (filter/separator) and secondary elements at 500 hours or 6 months whichever come first.

8. **Injection nozzle check**
   - Check injection opening pressure and spray condition. (This is a recommended maintenance item). Consult your local Ingersoll–Rand branch or distributor.

9. **Coolant level.**
   - Check coolant level and add coolant if necessary.

10. **Coolant leakage check**
    - Replace any damaged or malfunctioning parts which could cause leakage.

11. **Coolant system circuit cleaning**
    - Clean at intervals of 1000 hours or 12 months, whichever come first.

12. **Fan belt tension check**
    - Check and adjust fan belt deflection. Look for cracks, fraying and wear. Replace if necessary.

13. **Coolant replacement**
    - Change coolant at intervals of 1000 hours or 12 months, whichever comes first.

14. **Coolant filling cap function check**
    - Check radiator pressure cap periodically for proper operation.

15. **Battery electrolyte level check**
    - Replenish with distilled water if necessary.

16. **Battery cleaning**
    - Clean the terminals.

17. **Starter and generator check and cleaning**
    - Check wear condition of brush and commutator.

18. **Preheating condition check**
    - Ensure control panel element glows after 3 seconds in override/preheat position prior to starting.

19. **Air filter element replacement**
    - Change element at 500 hours or 6 months, whichever come first, or sooner if the restriction indicator shows red.

20. **Engine starting condition and noise condition**
    - Check engine stability and noise.

21. **Exhaust smoke condition**
    - Check exhaust smoke color.

22. **Cylinder compression pressure**
    - Consult your local Ingersoll–Rand branch or distributor.

23. **Valve clearance check**
    - Incorrect valve clearance will result in increased engine noise and lower engine output thereby adversely affecting engine performance. Check and adjust every 1000 hours. (see routine maintenance) or consult your local Ingersoll–Rand branch or distributor.

24. **Positive crankcase ventilation valve cleaning**
    - Check according to the equipment specifications. Perform the adjustment, cleaning, repair or replacement every 1000 hours. (This is a recommended maintenance item ★). Consult your local Ingersoll–Rand branch or distributor.
This item contains a simple troubleshooting. When a failure takes place on your Ingersoll–Rand engine, diagnose the cause referring this troubleshooting. Should the cause of failure not be detected or you are unable to manage the failure, consult your machine supply source or nearest Ingersoll–Rand engine service outlet.

</tbody>
</table>

**Excessive oil consumption**

- Incorrect oil
  - Wrong selection of type and viscosity.
  - Too much oil quantity.
- Engine burning oil
  - Faulty piston rings/damaged cylinder bores.
  - Faulty valve stem seal.
- Oil leakage
  - Damaged seal.
  - Loose joints/gaskets.
  - Improper installation of filter and piping.

**Excessive fuel consumption**

- Fuel leakage
  - Damaged seals.
  - Improper component installation or tightening.
- Excessive injection volume
  - Injection pump defective.
- Excessive mechanical loads
